Attachment: 9361 Soybean (April, 1986)

Exhibit A: Variety 9361 evolved from the cross of Essex X L69-4143. It is an F6-derived variety which was advanced to the F6 generation by modified single-seed descent. The F7 progeny row of 9361 was grown in Illinois during the summer of 1979. Subsequently, 9361 has undergone six years of extensive testing and purification, and has been observed by the breeder to be uniform and stable for all plant traits from generation to generation with no evidence of variants.

Seed hila of 9361 are light black in color, and under certain environmental conditions may appear imperfect black or gray in color. When seeds of these types are planted, they produce plants having seeds with light black hila color.

Five acres of 9361 (breeder's seed) were grown in 1984. 106 acres of parent seedstock (foundation seed equivalent) were grown in 1985.

Exhibit B: Variety 9361 is most similar to variety 3981. However, 9361 is significantly earlier than 3981 by almost 3 days (see Table 1).

Exhibit E: Pioneer Hi-Bred International, Inc. is the sole, original, and first breeder of '9361' variety of soybeans for which it solicits a certificate of protection.
